*"The Effect of Correctional and Rehabilitation Facilities on Property Values"*

- Abstract:** The construction of correctional facilities has surged by over 240 percent since 1980. Yet little research has focused on their unintended consequences, particularly how this affects nearby property values. To address this gap, I create a novel dataset that combines data on correctional and rehabilitation facilities with micro-level repeated sales data that overcomes omitted variable bias. I use the hedonic method in the form of a triple-difference to investigate the impact of these facilities on property values. I find that a new facility significantly decreases nearby property values by an average of 20 percent. Moreover, I find heterogeneous effects by the type of facility. These findings highlight the complex interplay between criminal justice policies and the unintended repercussions of prison expansion.
